

Microsoft Exchange Health Check

The Embrionic Microsoft Exchange Health Check examines your current Exchange environment, detects any deficiencies or problems, and provides appropriate recommendations.

This health check examines and reports on the following areas:

Assessment of current infrastructure

- Network topology
- Network services
- Known issues including outstanding support queries

Exchange Topology

- Administrative Group and Routing Group topology
- Hardware configurations and operating system and Exchange versions, service packs and hot fixes
- Addressing information including recipient policies
- Limits, restrictions and system policies
- Connectivity – Internet and / or to third party messaging systems
- Distribution lists

Operations and Security

- Management and monitoring
- Examination of current backup process
- Review recovery processes
- Media storage processes
- Business continuity
- Server hardening

Prerequisites

In order for you to get value for your investment you will need to ensure you provide the appropriate resource or resources that have the following:

- Understanding of the current network topology – bandwidth, sites, etc
- Knowledge of Active Domain Forest, Domain and Sites and has the appropriate AD rights
- Full access to Microsoft Exchange servers is provided

Deliverables

Upon completion of the health check you will be presented with a complete report which details the captured data during the analysis and highlight any recommendations including the steps to be undertaken.
